

# SIPG / Haifa Bayport K-Series Data Collection Manual

*This document is a practical guide for collecting and structuring the raw financial data needed to build a capital-stock (K) series for SIPG's Haifa Bayport terminal, aligned with the existing IPC/HPC K framework.*

---

## 1. Purpose and Scope

### 1.1 Goal of the SIPG / Bayport K-Series

We want a **monthly real capital stock series K<sub>t</sub> for Haifa Bayport** from **Jan-2018 through Dec-2024** (or as early as the project appears in financial accounts). This K series will be used to:

- Construct **ln(K/L)** as a mediator in productivity/event-study regressions.
- Compare capital deepening across **HPC (Haifa legacy)**, **IPC (state holding co.)**, and **SIPG/Bayport**.
- Perform robustness checks using different capital definitions (with/without WIP, with/without IFRS-16 lease assets, etc.).

We therefore need **PPE stocks and flows** for SIPG/Bayport in a way that mirrors the existing IPC/HPC structure.

### 1.2 Alignment with IPC/HPC Framework

Your existing K framework uses two core tables:

- **Table 1 – PPE Stock & Flows by Asset Class**

- Columns: `year, asset_class, cost_open, additions, transfers, cap_interest, disposals, cost_close, accdep_open, depreciation_expense, accdep_disposals, accdep_close, net_ppe_close`.

- Asset classes: `wip, equip_it, bldg_landside, marine, land, total`.

- **Table 2 – Cash-Flow Based Capex & Depreciation**

- Columns: `year, dep_amort_th_nis, purchase_ppe_cf_th_nis, capitalized_interest_ppe_th_nis, proceeds_sale_ppe_cf_th_nis, approx_gross_ppe_investment_th_nis`.

The SIPG data we collect must be mappable into this structure, even if we first work in the **original reporting currency (CNY)** and later convert/deflate.

---

## 2. Identify Target Reporting Entities

### 2.1 Parent Company – SIPG (Shanghai International Port Group)

- Publicly listed company (Shanghai Stock Exchange) with comprehensive **annual reports** and **interim reports**.
- Reports typically under **PRC GAAP with IFRS-like structure**; financial statements in **CNY**, often with English translations.
- Consolidated accounts include **domestic terminals** (Shanghai) and **overseas terminals** (including Haifa Bayport).

### 2.2 Project Company – Haifa Bayport / SIPG Bayport Terminal Ltd.

- There is usually a local Israeli SPV operating the Haifa Bayport concession.
- Potential sources:
  - Israeli **Registrar of Companies** filings.
  - SPV **bond prospectuses** (if it issued NIS bonds).
  - **Standalone audited financial statements** attached to regulatory filings or concession documentation.
- Documents from **Israel Ports Company / Ministry of Transport** about Bayport.

### 2.3 Segment Level Within SIPG Group

If we cannot get SPV standalone accounts, we fall back to SIPG's **segment disclosures**:

- Look for segments like **"overseas terminals"**, **"international business"**, **"overseas investments"**, etc.
- Some reports may break out **segment assets**, **non-current assets**, **capex** by region or major project.

### 2.4 Prioritization Tree

When searching and extracting, follow this priority order:

1. **Standalone Haifa Bayport SPV accounts** (best; use if found).
2. **SIPG segment-level data** where Haifa is identifiable (e.g., "Israel" line in overseas segment).
3. **Overall SIPG consolidated PPE** (fallback for scale and cross-checks; not ideal for Haifa-specific K but still useful).

Always keep track of which level each dataset refers to using an `entity` field (e.g., `sipg_consol`, `sipg_overseas`, `sipg_haifa_spv`).

---

## 3. Types of Reports to Collect

### 3.1 Annual Reports (Consolidated)

Collect SIPG **annual reports** for at least **2017–2024** (inclusive), in English or Chinese:

- Each report should contain:
- Consolidated **statement of financial position** (balance sheet).
- Consolidated **statement of cash flows**.
- Notes to the financial statements, especially:
  - **Property, plant and equipment**.
  - **Construction in progress / capital work in progress**.
  - **Right-of-use assets** (IFRS16).
  - **Intangible assets / concession rights** (if used for port concessions).
  - **Segment information**.
  - **Capital commitments**.

### 3.2 Interim and Semi-Annual Reports

Collect interim reports for key years (especially during construction and opening of Haifa Bayport):

- Semi-annual or quarterly reports around:
- **Start of construction**.
- **Major equipment deliveries** (STS cranes, yard cranes).
- **Terminal opening / ramp-up**.

These may contain:

- Updated PPE and CIP balances.
- Segment commentary: e.g., “overseas terminal in Israel commenced operations in 2021”.

### 3.3 Standalone Financial Statements – Haifa SPV

Search for the Bayport SPV's own accounts:

- Names might include: Shanghai International Port (Haifa), SIPG Bayport Terminal, Haifa New Port, etc.
- Target documents:
  - **Annual financial statements** (Hebrew or English) filed in Israel.
  - **Prospectuses** or bond reports.
  - Attachments to **concession agreements**.

If obtained, treat these as the **primary source** for Haifa-specific K.

### 3.4 Regulatory and Stock-Exchange Filings

- Shanghai Stock Exchange filings by SIPG:

- Announcements about **overseas terminal projects, investment budgets, concession contracts, guarantees**, etc.
- Often contain one-off figures like "total investment of the Israel Haifa terminal project is XXX million USD".
- Israeli regulators (ISA, TASE) if SIPG or the SPV issued local debt.

These are mainly for **scale checks** and timing, but sometimes provide explicit K numbers for Haifa.

### 3.5 Supplementary Sources

Not primary data, but useful for validation:

- Project brochures, news releases, or interviews mentioning total investment amounts.
- Academic or industry reports summarizing global port investments.

Record any concrete numerical claims (e.g., "total planned investment of USD 1.7 billion") in a side notes table with sources.

---

## 4. What to Look For Inside Each Report

This section tells you exactly which tables/notes to locate and what numbers to extract.

### 4.1 Balance Sheet – PPE and Related Lines

Locate the **consolidated balance sheet** (often called "Consolidated Statement of Financial Position"). Extract the following line items for each year and entity:

- **Non-current assets** section:
  - Property, plant and equipment (usually net).
  - Construction in progress or Capital work in progress.
  - Investment properties (likely exclude from port K unless clearly operational terminal land/buildings).
  - Right-of-use assets (IFRS 16). Decide later whether to include; default is **exclude** for comparability with IPC/HPC unless leases correspond exactly to terminal infrastructure.
  - Intangible assets where clearly labeled as **service concession arrangements** (e.g., port concession rights). Decide separately whether to include in K.

Record, for each line:

- Year.
- Entity ( `sipg_consol`, `sipg_haifa_spv`, etc.).
- Line name as in the report.
- Balance at year-end (and, if easily available, previous year's comparative figure for cross-check).
- Unit (thousands/millions) and currency.

These net figures are mostly for sanity checks; the detailed K construction will come from the PPE notes.

## 4.2 PPE Note – Stock & Flow Table

The PPE note is the core. It typically has a table like:

Cost: opening balance, additions, transfer from construction in progress, disposals, revaluation, FX differences, closing balance; and similar for accumulated depreciation.

For each **entity** and **year**, extract the PPE roll-forward by asset class:

1. **Identify asset classes** used by SIPG, e.g.:
  2. Land and buildings.
  3. Port equipment and machinery.
  4. Vessels/vehicles.
  5. Other equipment.
  6. Construction in progress.
7. For each asset class, record the following columns (even if some are zeros or not shown):
  8. `cost_open` – Opening gross carrying amount at beginning of year.
  9. `additions` – Additions during the year (usually cash or near-cash capex).
  10. `transfers` – Transfers (e.g., from construction in progress to PPE, from PPE to investment property, IFRS16 recognition). If tables separate "Transfer from CIP" and other transfers, keep them in sub-columns or aggregate into `transfers` with an additional `transfers_detail` note.
  11. `cap_interest` – Explicit line for "Capitalised borrowing costs" or "Capitalised interest" where it is **added to cost**.
  12. `revaluation_fx_other` – Revaluation increments/decrements, exchange differences, etc. (record them separately if possible; later decide whether to treat as genuine K changes).
  13. `disposals` – Disposals or write-offs during the year (negative numbers for cost removed).
  14. `cost_close` – Closing gross cost at year-end.
  15. `accdep_open` – Opening accumulated depreciation and impairment.
  16. `depreciation_expense` – Depreciation charge for the year.
  17. `impairment` – Impairment losses (or reversals) relating to PPE.
  18. `accdep_disposals` – Accumulated depreciation related to assets disposed of.
  19. `accdep_reval_fx_other` – Adjustments due to revaluation/FX (if shown).
  20. `accdep_close` – Closing accumulated depreciation and impairment.
  21. `net_ppe_close` – Net book value at year-end for that class (should equal `cost_close - accdep_close`).

22. If the PPE note splits **Construction in progress (CIP)** into a separate table, treat it as a separate asset class `wip`. Extract:
23. CIP opening balance.
24. Additions (capex still under construction).
25. Transfers to completed assets (negative from CIP; flows into other asset classes' `transfers`).
26. FX differences or revaluations, if any.
27. Closing CIP.
28. Always double-check the accounting identity:
29. For cost:  

$$\text{cost\_open} + \text{additions} + \text{transfers} + \text{cap\_interest} + \text{revaluation\_fx\_other} + \text{disposals} = \text{cost\_close}$$
 (allowing for signs on the terms).
30. For accumulated depreciation: 
$$\text{accdep\_open} + \text{depreciation\_expense} + \text{impairment} + \text{accdep\_reval\_fx\_other} + \text{accdep\_disposals} = \text{accdep\_close}$$
.

### 4.3 Construction in Progress / Capital Work in Progress Note

Often, CIP has its own note, especially in large infrastructure groups. For each year/entity:

- Extract the CIP roll-forward as described above.
- If the note lists **major projects** (e.g., "Yangshan Phase IV", "Haifa Terminal"), record:
  - Project name.
  - Balance at year-end.
  - Any additions during the year.

These project-level CIP balances are extremely valuable for isolating **Haifa-specific K** within the broader SIPG group.

### 4.4 Cash Flow Statement – Capex & Disposals

From the **consolidated statement of cash flows** and, if available, the SPV's own cash-flow statement, extract for each year/entity:

- Line for **"Purchase of property, plant and equipment"** (or "acquisition of fixed assets"). Use the value in the **investing activities** section.
- Line for **"Proceeds from disposal of property, plant and equipment"**.
- If separate, line for **"Payment for construction of concession assets"** or similar (decide later if and how to include in K).
- Line for **"Capitalised interest"** if shown in investing section; otherwise, find it in the PPE/CIP note.

Record these in a `sipg_ppe_cf` table mirroring your Table 2 (but initially in CNY or thousands of CNY).

## 4.5 Segment Information Note

In the **segment reporting** note, look for tables showing for each segment:

- Revenue, operating profit.
- **Segment assets** or **segment non-current assets**.
- Segment capex or additions to non-current assets.

We particularly care about any segment labelled "**overseas terminals**", "**international terminals**", "**other ports**", or "**Israel**". Extract:

- For each year: segment name, segment non-current assets, and segment capex/additions.

These numbers can help allocate consolidated PPE to Haifa where **entity-level SPV data are missing**.

## 4.6 Capital Commitments Note

Locate the note on **capital commitments** or "commitments in respect of property, plant and equipment". Extract:

- Total capital commitments contracted but not yet incurred.
- Portion specifically for **overseas terminals or Haifa project** (if given).
- Expected timing of expenditure (e.g., within 1 year, 1–5 years).

These figures are auxiliary; they don't feed directly into K but help you understand the project's time path and check that PPE jumps make sense relative to planned investment.

## 4.7 Leases and Concession Arrangements

Read the **leases** and **service concession arrangements** notes to understand:

- Whether terminal assets are recognized as:
  - Owned PPE.
  - Intangible concession rights.
  - Right-of-use assets under IFRS 16.

Document:

- Which line(s) contain the Haifa terminal concession.
- How amortization is treated (depreciation vs amortisation).

Later, you will decide whether to:

- Integrate intangible/ROU components into K (if they represent the same physical assets as IPC/HPC's PPE), or
- Exclude them for a narrower "tangible PPE only" K.

## 5. Extracting and Structuring the Raw Data

### 5.1 Units, Currency, and Scaling

For every table you extract, note:

- Whether figures are in **thousands**, **ten-thousands**, or **millions** of CNY.
- Whether decimals are shown.

In the raw extraction tables, **keep original units** (e.g., thousands of CNY). Later, in the processing pipeline, apply:

- Unit scaling to convert to **full CNY**.
- Currency conversion (e.g., **CNY**→**NIS** using period-average or year-end FX).
- Price deflation to constant NIS.

Record unit and currency in metadata columns (`unit`, `currency`) and/or the file README.

### 5.2 SIPG PPE Flows Table (Analog of Table 1)

Create a raw data file, e.g., `sipg_ppe_flows_raw.csv`, with columns:

- `year`
- `entity` (e.g., `sipg_consol`, `sipg_overseas`, `haifa_spv`)
- `asset_class_raw` (name as in report: "Buildings", "Port equipment", etc.)
- `asset_class_mapped` (one of: `wip`, `equip_it`, `bldg_landside`, `marine`, `land`, `other`)  
– this mapping can be filled later but plan for it.
- `cost_open`
- `additions`
- `transfers`
- `cap_interest`
- `revaluation_fx_other`
- `disposals`
- `cost_close`
- `accdep_open`
- `depreciation_expense`
- `impairment`
- `accdep_disposals`
- `accdep_reval_fx_other`
- `accdep_close`
- `net_ppe_close`
- `note_ref` (e.g., "Note 12", page number)

Extraction process:

1. For each annual report, open the PPE note.
2. For each line (asset class), copy the numerical row into your spreadsheet or CSV.

3. Keep **all columns exactly as in the note**; if multiple sub-columns exist (e.g., "Transfer from CIP" plus "Other transfer"), capture them separately, then sum into your `transfers` column when building the harmonised table.
4. After entry, verify the accounting identities per asset class as described in Section 4.2.

Later, you will **collapse** `asset_class_raw` to your **5 asset classes** to create a harmonized SIPG version of Table 1.

### 5.3 SIPG PPE Cash Flow Table (Analog of Table 2)

Create another file, `sipg_ppe_cf_raw.csv`, with columns:

- `year`
- `entity`
- `dep_amort_total` – total depreciation and amortization expense for PPE and related assets (if the statement groups them, record the combined figure and, if needed, a breakdown by PPE vs intangibles).
- `purchase_ppe_cf` – cash outflow for purchase of PPE.
- `proceeds_sale_ppe` – cash inflow from sale of PPE.
- `capitalised_interest_cf` – cash (or non-cash) capitalised interest, if disclosed.
- `other_ppe_cf` – any other PPE-related cash-flow line (e.g., "payment for construction of concession assets").
- `note_ref`.

The goal is to be able to reconstruct an **approximate gross investment** analog to your existing `approx_gross_ppe_investment_th_nis` column, once we understand how much of purchases + capitalised interest corresponds to Haifa.

### 5.4 Project Tagging for Haifa Bayport

Whenever the reports mention Haifa explicitly:

- In the CIP note: rows like "Overseas terminal project – Israel".
- In segment notes: mention of "Israel terminal".
- In capital commitments: "Construction of Israel Haifa terminal".

Create a separate table `sipg_haifa_project_tags.csv` with columns:

- `year`
- `entity`
- `note_ref`
- `project_name_raw`
- `asset_balance` – amount associated with that project.
- `line_type` – e.g., `cip_balance`, `commitment`, `segment_assets`, `segment_capex`.

These tagged rows will later allow you to **allocate a share of group-level PPE flows to Haifa**.

## 5.5 Versioning and Documentation

For every data value you enter, keep track of:

- PDF file name.
- Report year.
- Page number.
- Note number.
- Line description in original language.

Maintain a simple log (e.g., `sipg_data_log.md`) describing:

- When you added data for each year.
- Any difficulties or ambiguous classifications.

This mirrors the meticulous documentation you already maintain for IPC/HPC K.

---

## 6. Isolating Haifa Bayport K from SIPG Group Accounts

The key challenge is turning SIPG group data into **Haifa-specific K**.

### 6.1 Direct SPV Route (Best Case)

If you obtain **standalone financial statements** for the Haifa SPV:

1. Treat the SPV like HPC/IPC: run the full Table-1/Table-2 extraction process directly on its PPE notes and cash flows.
2. Confirm that:
3. SPV's PPE is in the SPV's functional currency (likely NIS or USD). Note the currency and units.
4. The SPV's PPE balances appear in SIPG's consolidated accounts under "overseas terminals" or similar (so you know coverage matches).
5. If the SPV has only a few asset classes (e.g., "Port facilities", "Machinery and equipment", "Motor vehicles"), map them to your classes using engineering judgment:
6. Port facilities → `marine` + `bldg_landside`.
7. Cranes/equipment/IT → `equip_it`.
8. CIP → `wip`.
9. Land rights → `land`.

This route gives a clean Haifa-only K series without additional allocation steps.

### 6.2 Segment-Allocation Route (If SPV Data Missing)

If you only have SIPG's consolidated and segment data:

1. Use the **project tags** from CIP, commitments, and segment notes to estimate the share of total **overseas terminal assets** that correspond to Haifa.

2. Example: Suppose in year  $t$ , the "Overseas terminals" segment reports non-current assets of 10bn CNY, and the CIP note shows a line "Haifa terminal" with 2bn CNY. You might infer that Haifa is roughly 20% of overseas terminal assets that year.
3. Construct a **Haifa share series**  $s_t$  by year, based on combinations of:
  4. CIP balances for projects labelled "Haifa".
  5. Capital commitments for Haifa relative to total overseas commitments.
  6. Public statements about total planned investment in Haifa versus other overseas projects.
7. Apply this share to:
  8. Segment PPE flows (if segment-level PPE notes are available).
  9. Or, if only group-level PPE flows exist: apply  $s_t$  to the subset of group asset classes that clearly pertain to overseas terminals.
10. Document all assumptions: e.g., "We allocate 25% of overseas PPE additions to Haifa in 2020 based on CIP composition from Note X".

This route is approximate but may be the only feasible approach if SPV accounts are unavailable.

### 6.3 Engineering / Physical Proxies Route (Last Resort)

If financial reporting is too aggregated to isolate Haifa, construct **engineering estimates** for Haifa K and tie them loosely to SIPG totals:

1. Collect physical data on Haifa Bayport:
  2. Berth length.
  3. Yard area (hectares).
  4. Number and type of cranes (STS, RTG/RMG), AGVs, etc.
  5. Other major equipment.
6. Collect **unit cost benchmarks** (from SIPG or other terminals) for:
  7. Cost per metre of berth.
  8. Cost per hectare of yard.
  9. Cost per STS crane, per RTG/RMG, etc.
10. Multiply physical quantities by unit costs to obtain an **engineering K estimate**.

11. Use SIPG financial disclosures on total investment in Haifa as a check; scale the engineering estimate to match the disclosed total if necessary.

This route should be clearly labelled as an approximation but might still be adequate if financial data are scarce.

---

## 7. Harmonisation with IPC/HPC K-Series

Once you have SIPG raw data, you must harmonise it with the IPC/HPC methodology.

### 7.1 Asset-Class Mapping

Define a mapping from SIPG's asset classes to your standard asset classes:

- **Land / Land use rights** → `land`.
- **Port and yard infrastructure** (berths, breakwaters, yard paving, buildings) → split between `marine` and `bldg_landside` if distinguishable; otherwise group as `marine`.
- **Cranes, yard equipment, vehicles, IT systems** → `equip_it`.
- **Construction in progress** → `wip`.
- **Other small classes** (office equipment, furniture) → include in `equip_it` or ignore if immaterial.

Create a mapping table `sipg_asset_mapping.csv` with columns: `asset_class_raw`, `asset_class_mapped`, `notes`.

### 7.2 Treatment of Revaluations and FX Effects

SIPG may have:

- Upward or downward revaluations of port land or infrastructure.
- FX translation adjustments for overseas assets.

Decide on a consistent rule, such as:

- Treat **revaluations** as changes in the value of K (affecting `cost_open` to `cost_close`) but record them separately as `revaluation_fx_other`.
- For **FX translation differences**, if you later convert everything to NIS, it may be cleaner to work in the original CNY and only translate once; in that case FX translation adjustments inside SIPG's accounts can be ignored for your own K series.

Document the rule in your README and apply it consistently across IPC/HPC and SIPG.

## 7.3 Treatment of Leases and Concession Rights

Establish a clear convention consistent with IPC/HPC:

- Option A (narrow): exclude IFRS 16 **right-of-use assets** and **intangible concession rights** from K; only include tangible owned PPE.
- Option B (broad): include ROU assets and concession rights that correspond to physical infrastructure.

If you choose Option A (likely easier and more comparable), ensure that:

- Only the PPE note relating to owned assets is used for K.
- Depreciation/amortisation related to ROU or concession intangibles is excluded from `depreciation_expense` used for K (if you can separate it).

State the chosen convention explicitly so later regressions can be interpreted correctly.

## 7.4 Time Aggregation to Monthly K

SIPG's reports are annual; you need monthly  $K_t$  for 2018–2024.

After constructing annual K at year-end:

1. Decide on timing assumptions:
2. Default: treat all net investment between  $t-1$  and  $t$  as occurring **mid-year**.
3. Convert annual flows into a **piecewise-linear monthly series**:
4. For each year, interpolate between `K_{t-1}` and `K_t` assuming linear accumulation.
5. Align with monthly L or  $L_p$  series:
6. For each month  $m$  in year  $t$ , set

$$K_{t,m} = K_{t-1} + (m/12)(K_t - K_{t-1})$$

7. Or use a mid-year step if that better matches your IPC/HPC methodology.

Document whatever rule you use so it matches the IPC/HPC pipeline.

---

## 8. Data Quality Checks and Reconciliation

Once extraction is complete, run systematic checks.

### 8.1 Internal Consistency per Asset Class

For each `year × entity × asset_class_raw`:

1. Check cost identity:

$$2. \text{cost\_close} - \text{cost\_open} - \text{additions} - \text{transfers} - \text{cap\_interest} - \text{revaluation\_fx\_other} - \text{disposals} \approx 0.$$

3. Check accumulated depreciation identity:

$$4. \text{accdep\_close} - \text{accdep\_open} - \text{depreciation\_expense} - \text{impairment} - \text{accdep\_reval\_fx\_other} - \text{accdep\_disposals} \approx 0.$$

Allow only small rounding differences.

## 8.2 Net PPE Check

Confirm that, for each asset class and total:

- $\text{net\_ppe\_close} = \text{cost\_close} - \text{accdep\_close}.$

Compare the total  $\text{net\_ppe\_close}$  with the balance sheet line  $\text{Property, plant and equipment}.$

## 8.3 Cross-Check with Cash-Flow Data

For each year/entity:

1. Compute from PPE flows:

$$2. \text{net\_additions\_accounting} = \text{additions} + \text{cap\_interest} + \text{transfers} + \text{revaluation\_fx\_other} + \text{disposals} \text{ (appropriately signed).}$$

3. Compare with cash-flow purchases and proceeds:

$$4. \text{purchase\_ppe\_cf} - \text{proceeds\_sale\_ppe}.$$

Large discrepancies signal non-cash acquisitions (e.g., IFRS16 adoption, asset injections) or classification differences; record them and, where possible, explain using note disclosures.

## 8.4 External Consistency Checks

Use external sources (press releases, project reports) to verify that:

- The **cumulative Haifa K** by completion year matches statements like "Total investment in Haifa Bayport is approximately USD X bn".
- The timing of large jumps in Haifa K aligns with construction milestones and opening dates.

## 8.5 Flagging Issues

Maintain an issues list with entries like:

- "2019 – unclear whether ROU assets for Haifa are included in PPE or separate; treat as excluded for now".
- "2020 – revaluation of port land: 300m CNY; included as revaluation\_fx\_other in K".

These notes are crucial for later robustness checks.

---

## 9. Final Deliverables for the New GPT Chat

To make the new SIPG-focused GPT chat maximally effective, aim to prepare the following files (even if some remain partially filled at first):

1. `sipg_ppe_flows_raw.csv` – annual PPE stock/flow table by entity and raw asset class, in original currency/units.
2. `sipg_ppe_cf_raw.csv` – annual capex & depreciation cash-flow data by entity.
3. `sipg_haifa_project_tags.csv` – project-level tags from CIP, commitments, and segment notes (especially anything mentioning Haifa/Israel).
4. `sipg_asset_mapping.csv` – mapping from SIPG asset classes to your standard (`wip`, `equip_it`, etc.).
5. `sipg_data_log.md` – narrative log of sources, page references, and decisions.

Later stages (which can be implemented with the help of the new GPT chat) will:

- Convert these raw files into harmonised **Table-1 and Table-2 style datasets** for SIPG.
- Apply allocation rules to isolate **Haifa Bayport K** from group or segment data.
- Merge SIPG's K series with the existing IPC/HPC series and interpolate to monthly frequency.

With this manual, a new GPT instance should be able to guide detailed extraction from SIPG's reports step-by-step and maintain full compatibility with your existing K-series infrastructure.
